

Authentik and Traefik Integration

Inspiration and Credit: [Brokenscripts](#)

This guide assumes you have a Traefik installation **v2.7** or higher by following the instructions/install script outlined on our Docker [Github Traefik](#) page.

Traefik Network name

Ensure you take note of the Traefik network name you create when you deploy Traefik. For the purposes of this guide, the traefik network name we will be using is **proxy**.

Authentik DNS Record

Ensure you have created a DNS record for Authentik. For the purposes of this guide, the DNS record we will be using is **sso.domain.tld**.

Forward Auth

According to the [Authentik documentation](#), in order to leverage Traefik with Authentik you must use Forward Auth mode instead of proxying in Traefik.
