

AD Integration

NOTE: This feature is only available with Hermes SEG Pro License.

Hermes SEG requires a listing of **Internal Recipients** in order to process incoming email and deliver that email to the correct recipient mailboxes located on an email server(s) that are specified under the **Gateway --> Relay Domains** part of the system.

Hermes SEG allows you to connect to Active Directory in order to automatically import the SMTP email addresses of your Active Directory users without having to manually input each one. The system will create Internal Recipients from each SMTP address it imports automatically. The import process can also be set to run at a scheduled interval so user additions or deletions will automatically be handled by Hermes SEG without manual intervention.

In order to import Internal Recipients via Active Directory you must first create an AD connection.

- Click the **Create Connection** button on top of the page (**Figure 1**)

Figure 1

- Under the **Connection Name** field, enter a descriptive name for the connection
- Under the **Domain Controller** field, enter the IP or the FQDN of a domain controller or simply enter the FQDN of your domain so you don't bind the connection to just one domain controller.
- Under the **Distinguished Name** field, enter the DN of the recipients locations, or you can simply enter the DN of the entire domain. For example, if your domain is east.domain.tld, your DN should be DC=east, DC=domain, DC=tld. Ask your Administrator if you have any questions
- Under the **Object Class** drop-down field, select **user**, **organizationalPerson**, **person** or **top** depending on the **objectClass** you wish to use to filter your AD users
- Under the **Netbios Domain Name** enter your domain Netbios name. For example, if your domain is domain.tld, your netbios domain could simply be DOMAIN. Ask your Administrator if you have any questions
- Under the **Domain User Username** field enter a username that has access to enumerate user objects in your domain

- Under the **Domain User Password** field, enter the password for the username that has access to enumerate user objects in your domain
- If you wish to schedule the automatic import of Internal Recipients on a specified interval, ensure you select **Yes** from the **Schedule SMTP Address Import from AD** drop-down, select the interval from the **Schedule Import Frequency** drop-down and click the **Submit** button (**Figure 2**)
