

# Console Settings

The Hermes SEG **Console Settings** sets the method you wish to access Hermes SEG machine which includes the Admin Console, User Console and the Ciphermail Console. By default, the **Console Mode** is set to **IP Address**, however, an IP address is not contusive to using SSL certificates. Therefore, if you plan to use a SSL certificate to access the Hermes SEG machine, you must set the Console Mode to **Host Name**. The Host Name you set it does NOT necessarily have to the the same **Host Name** you set in **Network Settings** above. The **Host Name** and **Primary Domain Name** you set in the Network settings is used for SMTP transactions such as SMTP TLS and it's not related to Hermes SEG console access.

- Set the **Console Mode** drop-down to **Host Name** and in the resultant **Host Name** field that appears, fill in the desired host anem you wish to use (**Figure 1**):

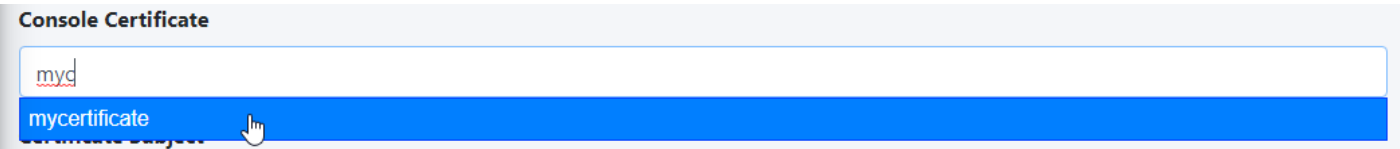

Figure 1

The screenshot shows the 'Console Settings' page. At the top right is a breadcrumb 'Home / Console Settings'. Below the title is a blue button with a plus icon and the text 'Generate DH Parameters File'. Under the heading 'Console Mode', there is a yellow warning box with a triangle icon and text: 'If you change the Console Mode to IP Address or Host Name ensure you change your browser's address to reflect the new system IP Address or the Host Name you set. This setting also sets the Ciphermail Portal and the User Console addresses.' Below this, a dropdown menu is set to 'Host Name'. Under the heading 'Host Name', a text input field contains 'smtp.domain.tld'. A red rectangular box highlights the 'Host Name' dropdown and the text input field.

- The **Console Certificate** field is pre-populated with the **system-self-signed** certificate. If you wish to use a SSL certificate you set in the **Set System Certificates** section above, simply delete the **system-self-signed** entry and start typing the friendly name of the certificate you setup previously that matches the host name. The system will locate the certificate and display it in a drop-down list. Click on the certificate and the system will automatically populate all the rest of the Certificate fields such as the Subject, Issuer, Serial and Type (**Figure 2**):

Figure 2

The screenshot shows the 'Console Certificate' section. It features a text input field with 'myd' typed in. Below the input field is a blue dropdown menu that is open, showing 'mycertificate' as the selected option. A mouse cursor is pointing at the 'mycertificate' option. Below the dropdown, the text 'Certificate Subject' is partially visible.

- We highly recommend that you enable **HTTP Strict Transport Security (HSTS)**, **Online Certificate Status Protocol (OCSP) Stapling**, **Online Certificate Status Protocol (OCSP) Stapling Verify** and click the **Submit** button (**Figure 3**):

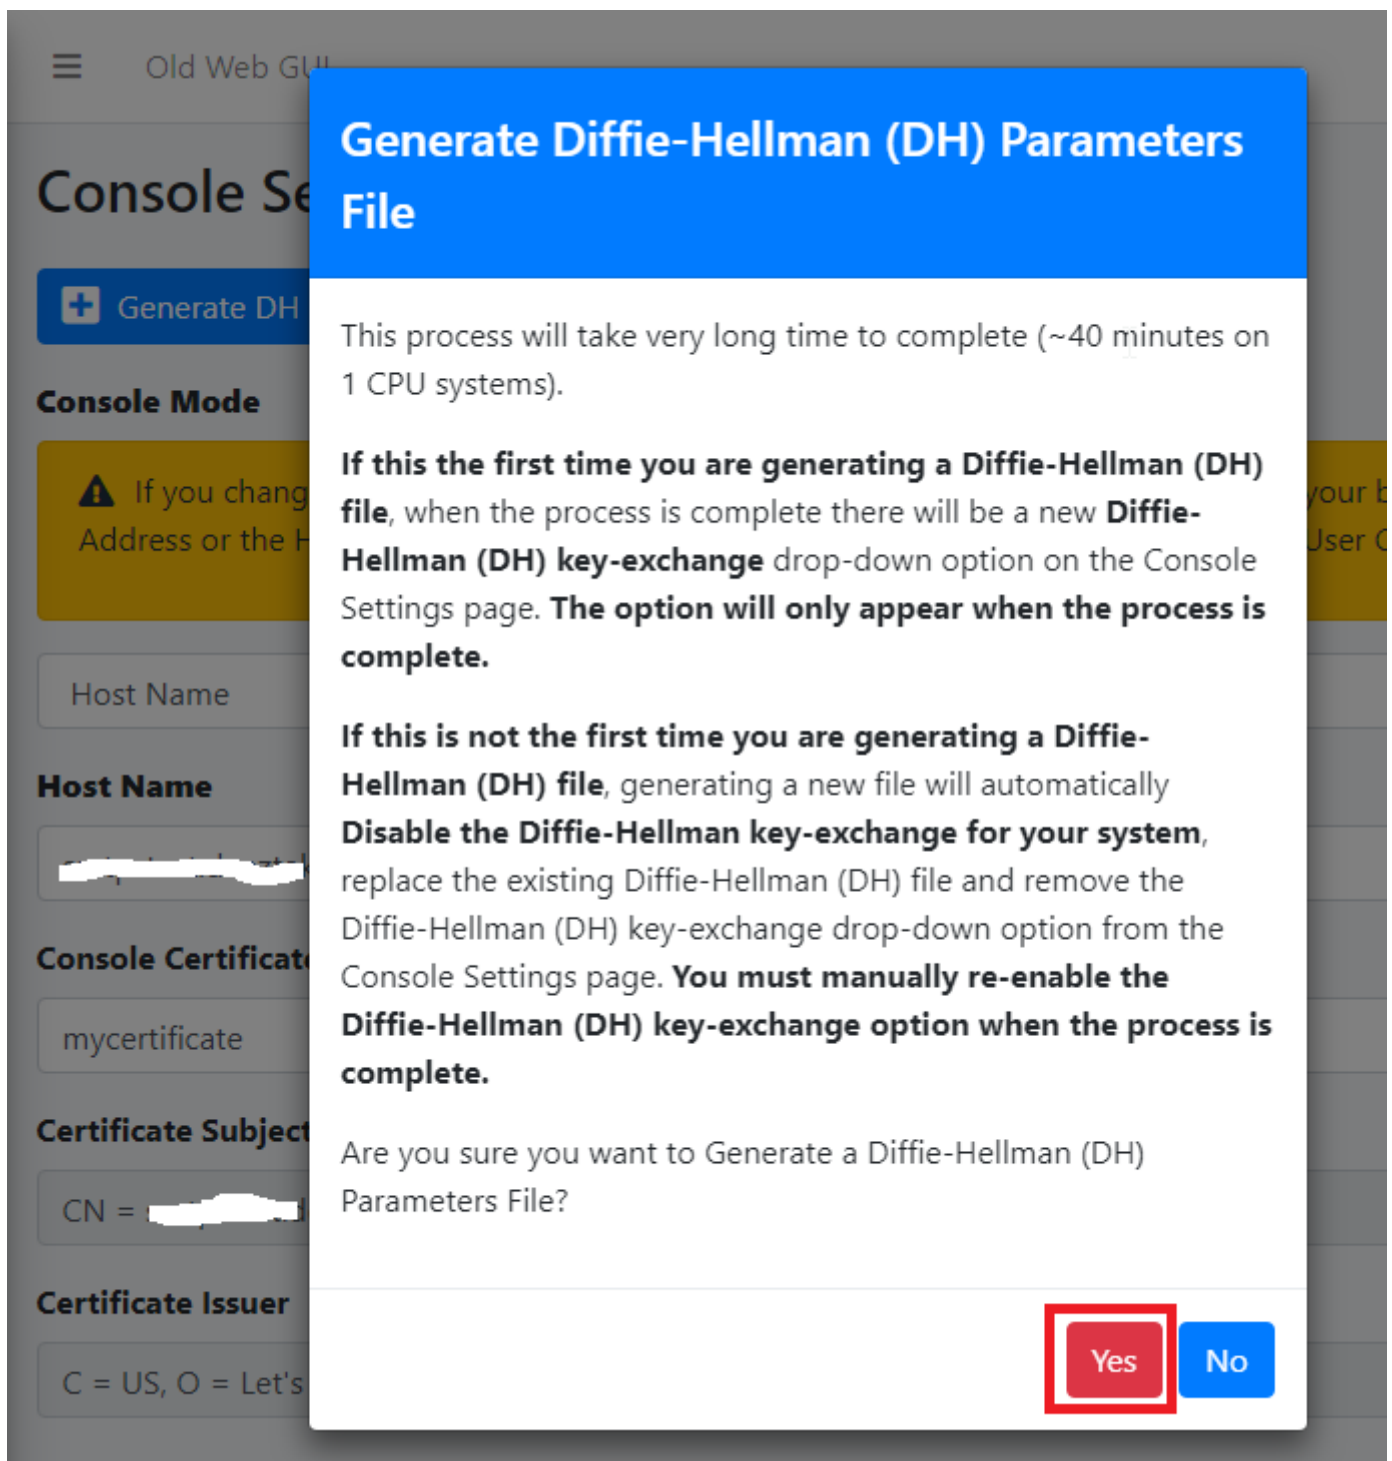

**Figure 3**

The screenshot shows a configuration interface with three sections, each with a dropdown menu and a 'Submit' button at the bottom. The first section is 'HTTP Strict Transport Security (HSTS)' with a dropdown set to 'Enable (Recommended)'. The second section is 'Online Certificate Status Protocol (OCSP) Stapling' with a dropdown set to 'Enable (Recommended)'. The third section is 'Online Certificate Status Protocol (OCSP) Stapling Verify' with a dropdown set to 'Enable (Recommended)'. The 'Submit' button is a blue button located at the bottom left of the configuration area.

After clicking the **Submit** button and you changed the Console Mode from IP Address to Host Name, your browser will **NOT** automatically redirect you to the new console address. Ensure you enter the new address in your browser as **https://<HOST\_NAME>/admin/** where **<HOST-NAME>** is the new Host Name you set above.

- Additionally, we recommend that you generate a **DH (Diffie-Hellman) Parameters** file by clicking the **Generate DH Parameters File** button and on the resultant **Generate Diffie-Hellman (DH) Parameters File** confirmation window, click on **Yes** (**Figure 4**):

**Figure 4**

- Generating a DH Parameters file can take a very long time to complete (~40 minutes on 1-CPU systems). You can proceed to configure the rest of your system (**DO NOT reboot the system while it's generate a DH Parameters file**) and check back under **System --> Console Settings** to see if a new **Diffie-Hellman (DH) key-exchange** drop-down appears set it to **Enable** and click the **Submit** button below (**Figure 5**).
