

External Recipients Encryption

Hermes SEG will send encrypted email to any external external recipient by by triggering the encryption though a keyword in an email subject (Please see **Encryption --> Encryption Settings** for more details) or by pre-configuring the external recipient for encryption. Triggering encryption by keyword in an email subject is certainly convenient but the problem with this approach is that it depends on the person sending the email to remember to enter the special keyword in the subject. If that person forgets to enter the keyword or misspells the keyword, the email will not be encrypted and potentially sensitive information can be compromised. For this reason, pre-configuring external recipients for encryption should be done whenever possible. On this page, you will be able to pre-configure external recipients for encryption as well as the type of encryption you wish to apply to each recipient.

Hermes SEG External Recipients Encryption are categorized in two categories: **Manual** and **Automatic** users. Manual users are external recipients that have been manually configured for encryption and automatic users are users that the system has automatically configured for encryption usually through the use of a subject trigger to send a PDF encrypted email to an external email address.

By default, a listing of **manually configured** external recipients will appear (assuming external recipients have been previously added) as evidenced by the **Show Manual Users Only** selection (**Figure 1**).

Create External Encryption Recipient

1. On the **External Recipients Encryption** page, click on the **Create External Recipient** icon to create a new External Recipient. You will be re-directed to the **Create External Encrypted Recipient** page.
2. On the **Create External Encrypted Recipient** page under the **Specify E-mail Address** field enter the address part on the field before the @ and the domain part after the @.
3. Under the **Select Encryption Type** field, select the type of encryption you wish to use and click the **Continue** button (**Figure 3**).

Figure 3

Mandatory PDF Encryption or PDF Encryption Triggered by E-mail Subject Keyword

Random Generated PDF Password through Secure E-mail Portal

Selecting this type of PDF encryption will configure the system to send encrypted PDF emails that will require the external recipient to access the Secure E-mail Portal and generate a random passwords that will then be used to open the encrypted PDF in order to read the email contents.

1. On the **Configure External Recipient PDF Encryption** page, select the **Random Generated PDF Password through Secure E-mail Portal** option.
2. Click the **Apply** button on the bottom of the page (**Figure 5**).

Figure 5

Configure External Recipient PDF Encryption

E-Mail Address

someone@somedomain.tld

Select PDF Encryption Type

- Random Generated PDF Password through Secure E-mail Portal (Recommended)
- Random Generated PDF Password Sent Back to Sender
- Specified PDF Password

PDF Password Age in Minutes (Ex: 60 = 1 Hour. Required when Back to Sender is selected. 15 Minutes Min)

60

PDF Password Length (Takes Effect Only when Back to Sender is selected)

- 160-Bits (Recommended)
- 128-bits

PDF Password (Required if Specified PDF Password selected. 8 characters, letters, numbers & special characters)

Verify PDF Password

Apply

- The **Apply** button will change to a **Please wait...** status (**Figure 6**).

Figure 6

Please wait...

- Once the system finishes configuring the external recipient encryption, it will redirect back to the **External Recipients Encryption** page (**Figure 7**). Note how the the **PDF Mode** under the **Encryption Status** column is set to **random**.

✓ Success!! External Recipient Configured

Random Generated PDF Password Sent Back to Sender

Selecting this type of PDF encryption will configure the system to generate random password which will be emailed back to the sender of the email. The sender will in turn have to provide that random password to the external recipient in order the external recipient to open the encrypted PDF and read the email contents.

1. On the **Configure External Recipient PDF Encryption** page, select the **Random Generated PDF Password Sent Back to Sender** option.
2. Selecting the **Random Generated PDF Password Sent Back to Sender** option, will automatically enable the **PDF Password Age in Minutes** and the **PDF Password Length** fields.
3. If needed, adjust the number of minutes under the **PDF Password Age In Minutes** field. This field sets the number of minutes the PDF password will be valid.

- If needed, adjust the **PDF Password Length** field. This field controls how long of a PDF password the system will generate. We recommend you leave it set to **160-Bits**.
- Click the **Apply** button on the bottom of the page (**Figure 8**).

Figure 8

someone@somedomain.tld	PDF Mandatory	PDF Mode static	S/MIME No	PGP No						

✔ **Success!! External Recipient Configured**

Mandatory S/MIME Encryption or S/MIME Encryption Triggered by E-mail Subject Keyword

1. After clicking the Continue button the system does not ask any more questions as is the case with configuring PDF Encryption. It simply configures the External Recipient for either Mandatory S/MIME Encryption or S/MIME Encryption Triggered by E-mail Subject Keyword and re-directs back to the External Recipient Encryption page. Note that **S/MIME** under the **Encryption Status** column will be set to either **Mandatory** or **Subject** depending on the S/MIME encryption type you chose earlier (**Figure 14**).

Figure 14

Recipient	Encryption Status				S/MIME Cert(s)	PGP Keyring(s)	Configure	PDF Passwd	Portal Passwd	Delete
someone@somedomain.tld	PDF No	PDF Mode N/A	S/MIME Mandatory	PGP No						

Success!! External Recipient Configured
You have selected S/MIME Encryption for this recipient. In order for S/MIME Encryption to work, you must create and/or import a S/MIME Certificate for this recipient

2. As mentioned above, S/MIME encryption requires certificates to either be generated or imported. Please refer to the Generate External Recipient S/MIME Certificate or the Import External Recipient S/MIME Certificate sections below.

Generate External Recipient S/MIME Certificate

Do not attempt to generate a S/MIME Certificate for an External Recipient unless you have already enabled S/MIME encryption on that recipient.

1. Under the **S/MIME Certificate(s)** section of the External Recipient you wish to generate a certificate, click on the icon.
2. You will be re-directed to the **Add Recipient S/MIME Certificate** page.
3. Assuming you have previously created an Internal Certificate Authority, under the **Certificate Authority** field, select the Internal Certificate Authority you wish to use to generate the S/MIME certificate.
4. Under the **S/MIME Certificate Validity Period**, select the number of years you wish this S/MIME Certificate to be valid. The default setting of 5 Years is recommended.
5. Under the **S/MIME Certificate Encryption Length**, select the length of the certificate. The default setting of 4096-bits is recommended.
6. Under the **S/MIME Certificate Algorithm**, select the algorithm you wish to generate the certificate. The default setting of RSA-SHA-512 is recommended.
7. Under the **Auto-Generate S/MIME Certificate and Private Key PFX password** field, select **Yes** to have the system automatically generate a password for the PFX file or select **No** if you wish to specify your own password. When generating a certificate, the system will also create a PFX file (Personal Information Exchange) and assign a password to it for security. A PFX file will contain both the public AND the private key of the generated certificate. The PFX file is used by the system for sending both the private and public key to the recipient that the certificate is being generated for for backup purposes

or for configuring an email client. It's recommended that you allow the system to generate a PFX file password.

- If you selected No in the **Auto-Generate S/MIME Certificate and Private Key PFX password**, enter the password you wish to use under the **S/MIME Certificate and Private Key PFX password** and enter the same password under the **Verify S/MIME Certificate and Private Key PFX password** field.
- Click on the **Create Certificate** button (**Figure 15**).

✓ Success!! External Recipient S/MIME Certificate created

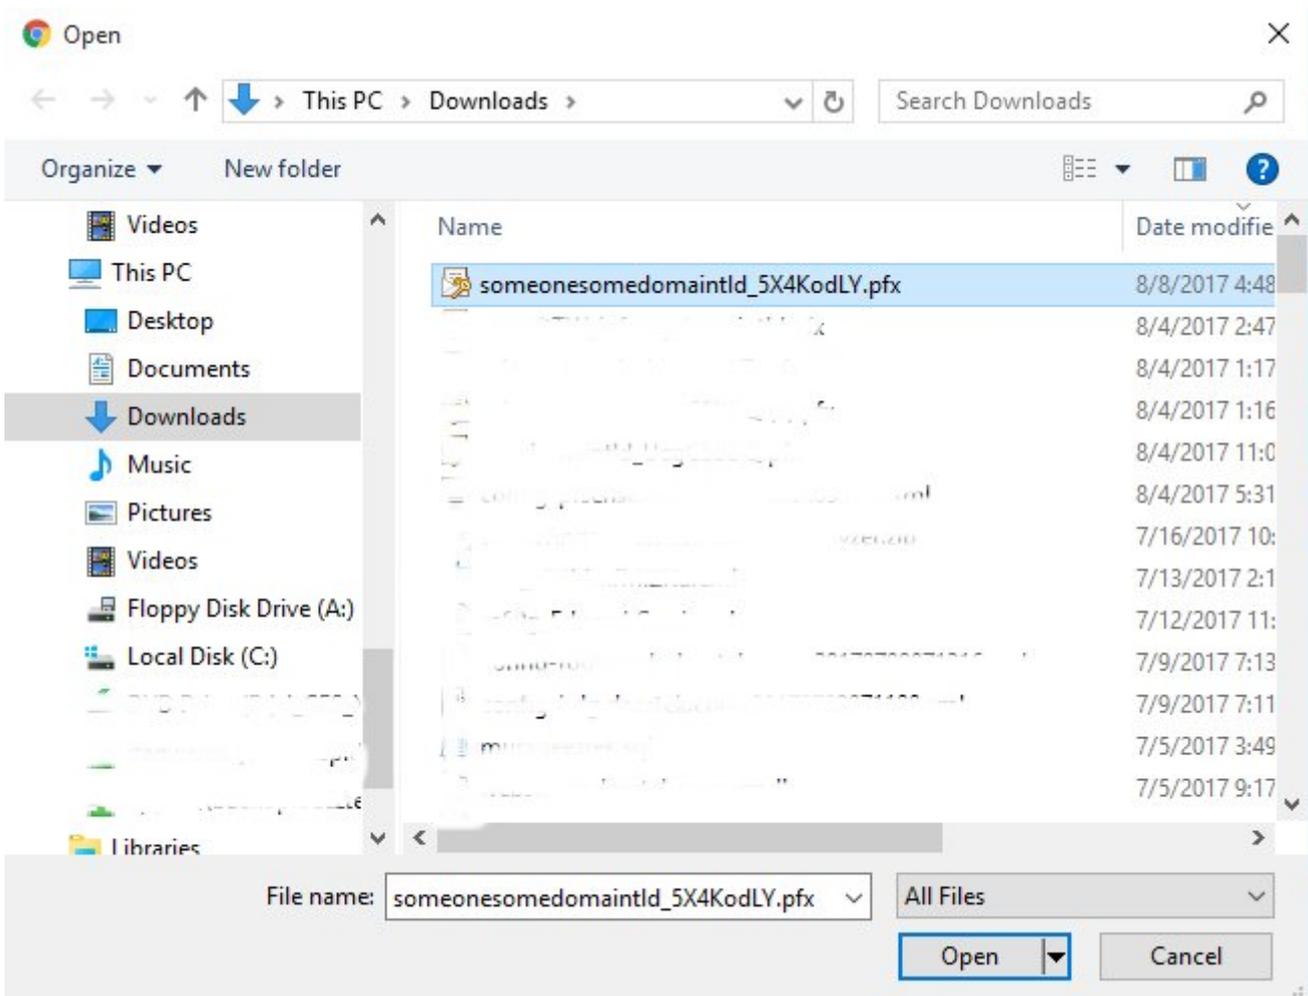

Import External Recipient S/MIME Certificate

Do not attempt to import a S/MIME Certificate for an External Recipient unless you have already enabled S/MIME encryption on that recipient.

Hermes SEG ONLY supports importing S/MIME certificates from PFX (Personal Information Exchange) files. Ensure that you have a PFX file which will contain both the certificate and the private key along with the password of the PFX file before proceeding.

1. Under the **S/MIME Certificate(s)** section of the External Recipient you wish to import a certificate, click on the  icon.
2. You will be re-directed to the **Import Recipient S/MIME Certificate** page.
3. Under the **Select PFX File** section, click on the **Choose File** button.
4. Browse to the location of the PFX file, select the file and click the **Open** button (**Figure 17**).

Figure 17

5. The name of the PFX file you chose will appear next to the **Choose File** button (**Figure 18**).

Figure 18

Select PFX file (.pfx files only)

Choose File someonesom...4KodLY.pfx

6. Under the **PFX file password** field, enter the password to the PFX file (**Figure 19**).

Figure 19

PFX file password

.....

7. Under the **Add to Certificate Trust List** field, select **Yes** to add the certificate to the system Certificate Trust List. **Selecting Yes is always recommended** unless you have a specific reason not to trust the certificate you are importing. In that case, select No (**Figure 20**).

Figure 20

Add to Certificate Trust List

- YES (Recommended)
 NO

8. Click the **Import Certificate** button (**Figure 21**).

Figure 21

Import Certificate

9. After a successful import, click on the **Back to External Recipients Encryption** button on the bottom of the page (**Figure 22**).

Figure 22

Back to External Recipients Encryption

10. Back at the **External Recipients Encryption** page, under the External Recipients listing on the S/MIME Certificate(s) section of the recipient you just imported a certificate, you will note the  icon which will now be enabled and clickable indicating that there are certificates present (**Figure 23**).

4. If necessary, provide the password to the PFX file to the recipient via secured means.

Mandatory PGP Encryption or PGP Encryption Triggered by E-mail Subject Keyword

1. After clicking the Continue button the system does not ask any more questions as is the case with configuring PDF Encryption. It simply configures the External Recipient for either Mandatory PGP Encryption or PGP Encryption Triggered by E-mail Subject Keyword and re-directs back to the External Recipient Encryption page. Note that **PGP** under the **Encryption Status** column will be set to either **Mandatory** or **Subject** depending on the PGP encryption type you chose earlier (**Figure 27**).

Figure 27

Recipient	Encryption Status		S/MIME Cert(s)	PGP Keyring(s)	Configure	PDF Passwd	Portal Passwd	Delete		
someone@somedomain.tld	PDF No	PDF Mode N/A	S/MIME No	PGP Mandatory	  	  				

2. As mentioned above, PGP encryption requires PGP Keystores to either be generated or imported. Please refer to the Generate External Recipient PGP Keystore or the Import External Recipient PGP Keystore sections below.

Generate External Recipient PGP Keyring

Do not attempt to generate a PGP Keyring for an External Recipient unless you have already enabled PGP encryption on that recipient.

1. Under the **PGP Keyring(s)** section of the External Recipient you wish to generate a PGP Keyring, click on the  icon.
2. You will be re-directed to the **Add Recipient PGP Keyring** page.
3. Under the **Recipient Real Name** section, enter the recipient's First and Last Name.
4. Under the **PGP Keyring Size**, select the size of the keyring. The default setting of 4096-bits is recommended.
5. Under the **Auto-Generate PGP Secret Key Password** field, select **Yes** to have the system automatically generate a password for the Secret Key or select **No** if you wish to specify your own password. It's recommended that you allow the system to generate a Secret Key password.
6. If you selected No in the **Auto-Generate PGP Secret Key password**, enter the password you wish to use under the **PGP Secret Key Password** and enter the same password under the **Verify PGP Secret Key Password** field below the first one.
7. Click on the **Create Keyring** button (**Figure 28**). Please note that clicking the **Create Keyring** button will not change the button status and the system may appear unresponsive. Please wait until the keyring get created and the system re-directs you back to the **External Recipients Encryption** page.

someone@somedomain.tld	PDF No	PDF Mode N/A	S/MIME No	PGP Mandatory								

✔ Success!! External Recipient PGP Key deleted

Download Public Key or Private Key

Downloading the Public and Private Keys is useful for importing those keys in 3rd party PGP applications such as Enigma, Kleopatra etc.

1. Click on the icon under the **Download Public** or the **Download Private** column of the key you wish to download. Your browser will automatically begin downloading the key you clicked in **ASCII armor** format.

View Private Key Password

This feature is useful in determining the Private Key password that the system automatically generates when generating a PGP Keyring. NEVER share Private Key passwords via unsecured means such as unencrypted email, SMS text etc.

1. Click on the icon under the **View Password** column of the key you wish to view the private key password.
2. You will be re-directed to the **View Recipient PGP Private Key Password** page (Figure 38).
