How to Set PHP Options for Wordpress in Docker Compose

Create a new file named **wordpress.ini** and and enter the following entries in it:

```
file_uploads = On
memory_limit = 256M
upload_max_filesize = 64M
post_max_size = 64M
max_execution_time = 300
max_input_time = 1000
```

In the Wordpress **docker-compose.yml** file, mount the file as a volume as follows:

```yaml
version: '2'
services:
  wordpress:
    depends_on:
      - db
    image: wordpress:5.5.0-php7.2-apache
    ports:
      - "8080:80"
    restart: always
    environment:
      WORDPRESS_DB_HOST: db:3306
      WORDPRESS_DB_PASSWORD: P@ssw0rd2
    volumes:
      - ./wordpress.ini:/usr/local/etc/php/conf.d/wordpress.ini
  volumes:
    db_data:
```

Restart the wordpress container:

```
docker-compose down && docker-compose up -d
```
